

# Clinical Case Photos

## 4 yr old, female patient

presented with a very tight lingual frenum that restricts the patient's range of motion. She can stick her tongue out, but can barely raise her tongue up. When she sticks her tongue out, it forms a heart shape at the tip, demonstrating how tight the attachment is.

### Before

Tongue tethered at the tip

2-3 mm of movement in any direction

### After

Pictures taken immediately post procedure

Post Frenectomy: She was able to lift and extend her tongue for a far greater range of motion.
